

Growth Marketing Specialist — Portfolio Project This repository documents the setup process completed as part of a job application portfolio project. It is independent of the hiring company and is meant to demonstrate tooling setup, problem-solving, and documentation practices.

Tools Installed - ****Cursor IDE**** — installed from [\[cursor.com\]\(https://cursor.com/\)](https://cursor.com/) - ****Claude Code**** — installed as a CLI tool (see Issues below for why) - ****Codex**** — added as a Cursor extension and logged in successfully

Steps Completed

1. Installed Cursor IDE
2. Attempted to add the Claude Code extension via Cursor's Extensions panel
3. Installed Claude Code CLI instead, after running into the issue below
4. Added the Codex extension in Cursor and logged in
5. Created this public GitHub repository
6. Opened the repository in Cursor
7. Documented the process in this README
8. Committed and pushed to GitHub

Issues & Resolutions ****Issue:**** The Claude Code extension in Cursor required a paid Claude plan to log in. I'm on the free plan, so I wasn't able to authenticate the extension through Cursor's Extensions panel. ****Resolution:**** I installed the ****Claude Code CLI**** instead, which worked with my existing account and let me access the same core functionality from the terminal rather than inside the Cursor extension panel. This achieved the same end goal — having Claude Code available as part of my workflow — through a different installation path. **##**

Notes No other issues were encountered. Codex and the rest of the setup worked as expected.
